

Working with Functions

Database Fundamentals

What you will learn

At the core of the lesson

You will learn how to do the following:

- Identify built-in functions.
- Examine the DATE functions that can be used in calculations.
- Calculate data by using aggregate functions.
- Manipulate string values.

Key terms:

- Aggregate functions
- Conversion functions
- Date functions
- String functions
- Mathematical functions
- Control flow functions
- DISTINCT
- COUNT
- Character strings

Functions

Built-in functions

Some common functions include aggregate functions, conversion functions, date functions, string functions, mathematical functions, and control flow and window functions.

Aggregate functions

Conversion functions

Date functions

String functions

Mathematical functions

Control flow and
window functions

Built-in functions: Example syntax

The CURRENT_DATE() function returns the current date as a value in 'YYYY-MM-DD' format.

```
SELECT CURRENT_DATE();
```

Function

```
-> 'YYYY-MM-DD'
```

Returns current date

Built-in functions: Another example syntax

The DATE_ADD() function adds a time or date interval to a date and returns a value.

Query

```
DATE_ADD (date, INTERVAL value addunit);
```

Output

```
SELECT DATE_ADD ('YYYY-MM-DD', INTERVAL 3 DAY);
```

Aggregate functions

Common aggregate functions

| Aggregate Function | Use Case and Example |
|--------------------|---|
| AVG | <ul style="list-style-type: none">• Returns the average of a set• Can be used to find the average population for cities within a specified country |
| COUNT | <ul style="list-style-type: none">• Returns the number of items in a set• Can be used to find the total number of cities listed within a specified country |
| MAX | <ul style="list-style-type: none">• Returns the maximum value in a set• Can be used to find the city with the greatest number or the highest population |
| MIN | <ul style="list-style-type: none">• Returns the minimum value in a set• Can be used to find the city with the smallest number or the lowest population |
| SUM | <ul style="list-style-type: none">• Returns the total of all values in a set• Can be used to find the total population for all of the cities that are listed for a specified country |

Aggregate functions: Example syntax

Query

Aggregate function name

```
SELECT COUNT(*) AS 'Total Number of Rows' FROM countrylanguage;
```

AS clause creates an alias

Table

Output

Total Number of Rows

984

Aggregate function return value

Aggregate functions: Example syntax (continued)

Query

```
SELECT AVG(LifeExpectancy)
FROM country;
```

Aggregate function

Aggregate function name

Output

```
AVG(LifeExpectancy)
-----
72.51200
```

Aggregate function return value

Activity

Activity: Using the SUM function

In this activity:

- AnyCompany Publishing House is examining their country table.
- Discuss how to query the country table by using the SUM function. Feel free to annotate your findings to begin your discussion.

To do:

- Review the column headings, and annotate which columns you could use with the SUM function.
- Create a query that sums the total population for all of the countries.
- After creating your list and query, be ready to explain your findings to the class.

Hint: Review slides 7–9 for information about aggregate functions.

Time: 10 mins

| Country | |
|-----------------|-----------|
| Column Headings | Type |
| Code | Character |
| Name | Character |
| Continent | Character |
| Region | Character |
| SurfaceArea | Float |
| IndepYear | Integer |
| Population | Integer |
| LifeExpectancy | Float |
| GNP | Float |
| GNPOld | Float |
| LocalName | Character |
| Capital | Character |
| Code2 | Character |

DISTINCT keyword

DISTINCT (different) keyword

Query

DISTINCT keyword

Column names

```
SELECT DISTINCT CountryCode, District
FROM city;
```

Output

| CountryCode | District |
|-------------|------------------|
| BRA | Distrito Federal |
| BRA | Rio de Janeiro |
| BRA | Sao Paulo |
| CHN | Guangdong |
| CHN | Shanghai |
| GBR | England |
| GBR | Scotland |

Distinct (unique) value combinations
for the selected columns

DISTINCT in a COUNT function

Query

DISTINCT keyword

```
SELECT COUNT(DISTINCT CountryCode) AS Unique_Country_Codes  
FROM city;
```

Output

```
Unique_Country_Codes  
-----  
118
```

The query returns the number of unique country code values in the table.

Character strings and string functions

String function: CHAR_LENGTH()

Query

```
SELECT CHAR_LENGTH('District');
```

A string literal is enclosed in single quotation marks (' ') or double quotation marks (" ").

Returns the length of the string measured in characters

String parameter

Output

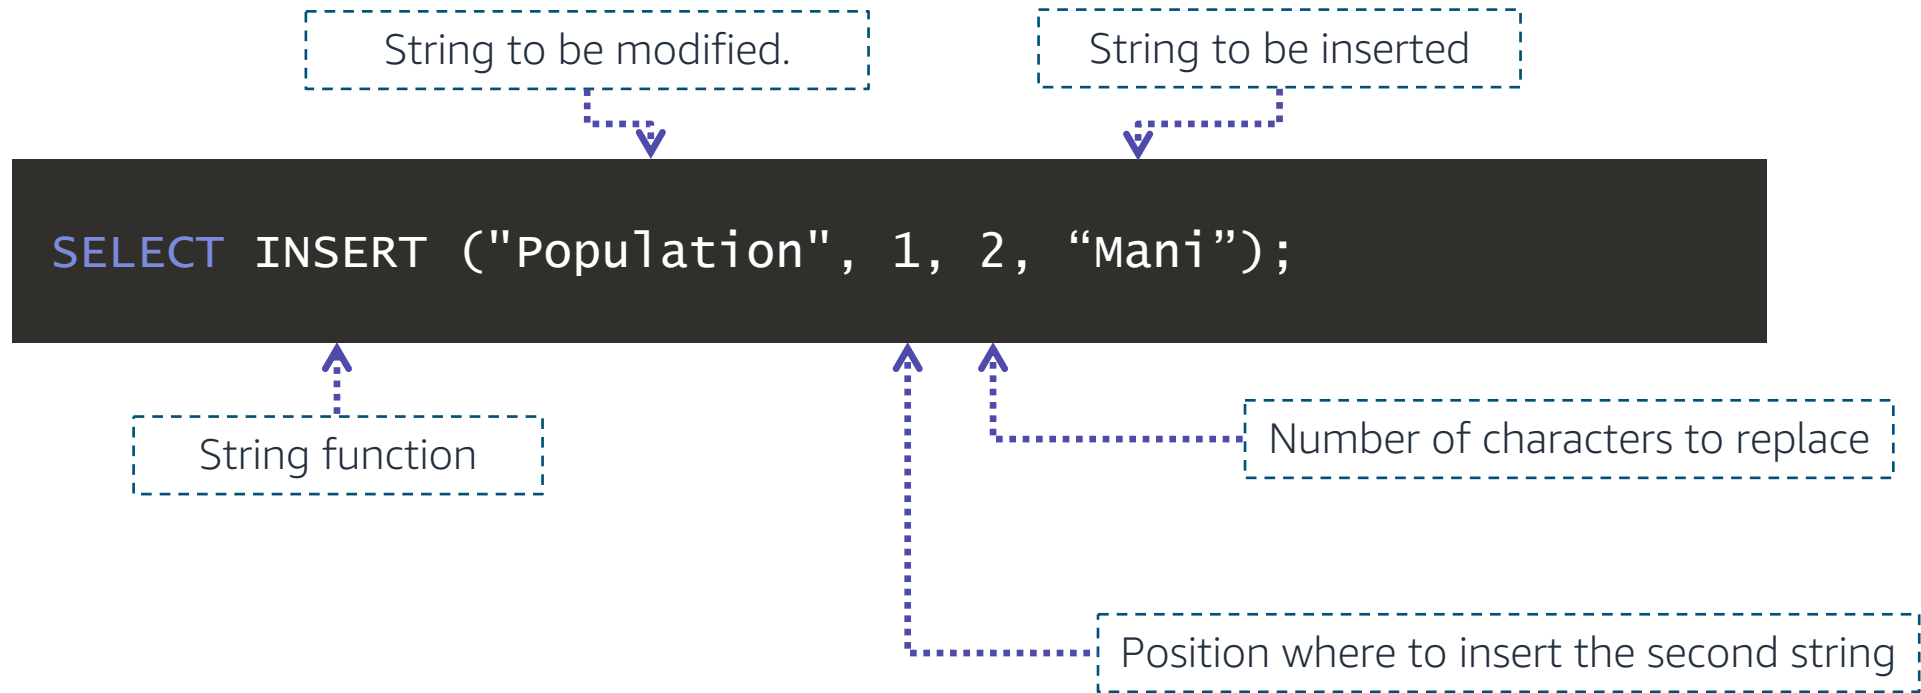

```
CHAR_LENGTH('District')
```

```
-----
```

```
8
```

String function: INSERT()

Query

Output

```
INSERT ("Population", 1, 2, "Mani")
-----
Manipulation
```

Leading and trailing spaces in a string

Extra spaces in a string can cause issues when querying for specific data.

TRIM functions: RTRIM() and LTRIM()

- The RTRIM() function removes blank spaces to the right of a string.
- The LTRIM() function removes blank spaces to the left of a string.

Query

RTRIM removes blank spaces on the right end of the string data values.

```
SELECT ID, RTRIM(District) AS District  
FROM city;
```

Output

| ID | District |
|------|-------------|
| 1024 | Maharashtra |
| 2331 | Seoul |
| 3793 | New York |

No spaces to the right of the string values
for the District column

Checkpoint questions

Which functions remove leading and trailing spaces on strings?

What is an aggregate function?

What are five common aggregate functions?

Key takeaways

- SQL has built-in functions. Common functions include the following:
 - Aggregate functions
 - String functions
 - Date functions

Thank you
